

General Information

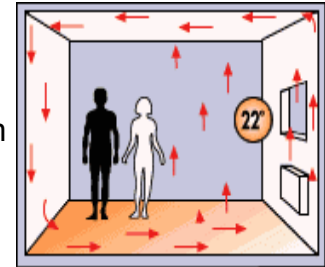

What is electric radiant floor heating?

Standard heating

It is an under floor heating system which warms the floor of the room, dispersing heat gradually throughout the room.

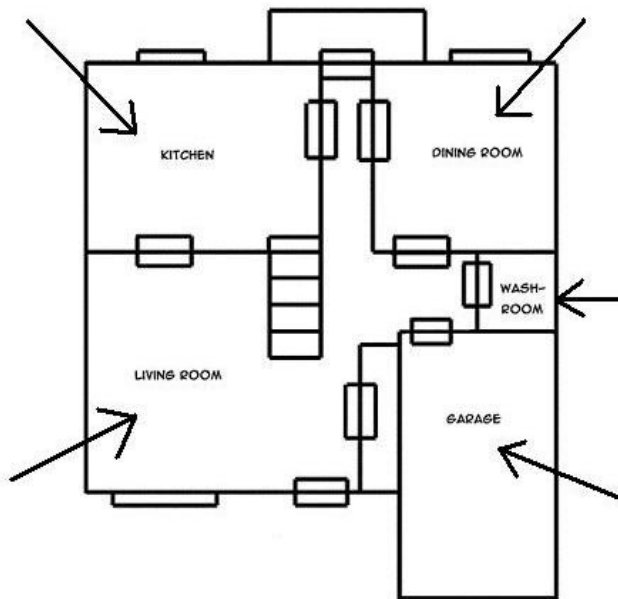

As you can see from the picture, when a room is heated with standard heating, the air is force dried, and most of your heat is at the ceiling, while all of the cold air is at the floor. With floor heating, the room stays at a constant, even temperature.

Radiant Floor Heating

How does electric floor heating work?

Our systems use electrical resistance cable to create heat from under the flooring surface. A thermostat controls the temperature of the room.

Where can the systems be installed?

Electric radiant floor heating systems can be used in almost any application: bathrooms, kitchens, children's play rooms, garages, and more.
